Early detection of AAA can be harmful

Jes Lindholt

Odense University Hospital Denmark

PARIS, FRANCE

Disclosure
Speaker name:
Jes S. Lindholt
I have the following potential conflicts of interest to report:
□ Consulting
☐ Employment in industry
□ Shareholder in a healthcare company
Owner of a healthcare company
□ Other(s)
I do not have any potential conflict of interest

Early detection of AAA can be harmful

- regardless of screen-detected or incidental

Consequences regarding:

Surveillance:

Potential pscyhological consequences

Preventive repair:

Potential pscyhological consequences

Complications

Procedure related death

Surveillance and redos

The Viborg study

1994-98

RCT, N=12,500

The VIVA trial 2008-

2011

RCT, N=50,000

The DANCAVAS trial

2015- ongoing RCT, N=45,000

JANUARY 19-21 2017

Detection of AAA may be harmfull:

Surveillance: psychological consequences

Experience from non-AAA screening programmes point to risks of:

- Stigmatisation
- Fear,
- Aggression,
- Emotional reactions,
- Psychosomatic reactions,
- Social isolation,
- Nocebo effects (opposite to placebo effect)
- "Blame the Victim"reactions

Detection of AAA may be harmfull:

Surveillance: psychological consequences

Lindholt JS, Vammen S, Fasting H, Henneberg EW. Psychological consequences of screening for abdominal aortic aneurysm and conservative treatment of small abdominal aortic aneurysms Eur J Vasc Endovasc Surg. 2000 Jul;20(1):79-83.

Jean Pierre Laroche:

Jes, what on Earth do you know about psychometrics?

Materia
Prospec
and you send the questionnaire together with the call for the annual control scanning

— that's most likely not generalisable to daily life?

Diagnosis of an AAA seems to impair QL permanently and progressively in conservatively treated cases*.

This impairment seems completely reversible by operation compared to controls.

Nevertheless, the impairment seems considerable, and must be considered in the management of AAA and in the final evaluation of screening for AAA.

Lancet. 2002;360(9345):1531-9. The Multicentre Aneurysm Screening Study (MASS) into the effect of abdominal aortic aneurysm screening on mortality in men: a randomised controlled trial. Ashton HA, Buxton MJ, Day NE, Kim LG, Marteau TM, Scott RA, et al.

		6 weeks after screening				3 and 12 months after detection of aneurysm or surgery							
						3 months			12 months				
		Negative (n=631)	Positive (n=599)	p*	Controls (n=726)	Surveillance (n=426)	Surgery (n=129)	р	Surveillance (n=426)	Surgery (n=129)	р		
110	State anxiety (20–80), clinical cutoff=42†	29-5	30-9	0.020	31.5	28.9	29-1	0.292	29-6	28-6	0-323		
	Depression (0–21), clinical cutoff=15†	3.0	3.3	0.092	3.5	3.0	3.0	0.835	3.2	3.1	0-394		
	SF-36 (0-100)‡ Physical health Mental health	51·2 51·5	49·7* 49·8	0-003	50-0 50-0	51·0 51·7	50·0 48·4	0·295 0·004	49·8 50·1	51·1 50·6	0·086 0·311		
	EQ-5D‡ Weighted health index (0–1) Self-rating (0–100)	0-83 80	0·81 76	0-045 0-0003	0·80 78	0·83 77	0·85 80	0·084 0·0003		0·85 81	0·577 0·0007		

p values <0.010 were judged significant. *Comparing men with negative and positive screening results. †Higher scores denote poorer states. ‡Higher scores denote better states.

Preventive repair

 Screening RCTs show that approx. 2 elective repairs are needed to prevent 1 AAA related death

A genuine ethical dilemma which currently can't be solved

 Approx. half of those referred for elective repair risk complications and death for a condition they never would have had any trouble with, if left unrepaired Meta-analysis of postoperative mortality after elective repair of abdominal aortic aneurysms detected by screening. Br J Surg. 2011 May;98(5):619-22

Blind justice?

ANUARY 19-21 2017
ARRIOTT RIVE GAUCHE & CONFERENCE CENTER
PARIS, FRANCE

Population based view:

Longer and better life due to:

- earlier CVD prevention
- earlier preventive repair
- more frequent preventive repa
- less risk of preventive repair

 less reduced Qol due to less surviving rupture

We are doctors
We are intellectuals
We are elitary
We know best
We'll decide over
others human bodies

Gains QALY cost-effectively

Individualized view

Stigmatisation
Fear,
Aggression
Emotional reactions,
Psychosomatic reactions,
Social isolation
Nocebo effects (opposite to placebo effect)
"Blame the Victim" reactions

Overdiagnosing

Complications and deaths for AAA which wouldn't have caused you harm left untreated

Even properly informed, men +65 are not old enough to make a wise decision over their own body
